Solution: (d); $\ln(x+y) = -y \ln y \Rightarrow \frac{1}{x+y} \left(1 + \frac{dy}{dx}\right) = \frac{-y}{x} - \ln x \frac{dy}{dx}$

 $\Rightarrow \frac{\mathrm{d}y}{\mathrm{d}x} \left(\frac{1}{x+y} + \ln x \right) = \frac{-y}{x} - \frac{1}{x+y} \Rightarrow \frac{\mathrm{d}y}{\mathrm{d}x} = \frac{-(xy+x+y^2)}{\{1+(x+y)\ln x\}} \text{ (Ans.)}$

(a) y = m(x - b)

(b) x = mv + b

(c) y = mx + b

Solution: (a); Let st. line be y = mx + c

 $\Rightarrow mx = y - c \Rightarrow x = \frac{y}{m} - \frac{c}{m} \text{ but } \frac{c}{m} = b \Rightarrow c = bm \text{ } \therefore y = mx - bm \Rightarrow y = m(x - b)(Ans.)$

(c) 7x - 10y + 18 = 0 (d) 10x - 7y + 18 = 0

Solution: (No correct answer); Radius = $\sqrt{(7-3)^2 + (7-10)^2} = 5$

- $\therefore \text{ equation of circle} = (x 7)^2 + (y 7)^2 = 25$
- $\therefore 2x 14 + (2y 14)\frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{14 2x}{2y 14} \therefore \frac{dy}{dx} \Big|_{(3,10)} = \frac{4}{3}$

Solution: (c); Let $1 + \sqrt{x} = z \Rightarrow \frac{1}{2\sqrt{x}} dx = dz \Rightarrow \frac{1}{\sqrt{x}} dx = 2dz$

Now, $\int \frac{dx}{x + \sqrt{x}} = \int \frac{dx}{\sqrt{x}(1 + \sqrt{x})} = \int \frac{dx}{\sqrt{x}} \cdot \frac{1}{1 + \sqrt{x}} = 2 \int \frac{dz}{z} = 2 \ln z + c = 2 \ln(\sqrt{x} + 1) + c \text{ (Ans.)}$

For triangle area =
$$\frac{1}{2} \times 2a \times a^2 = a^3$$
 :: Ratio = $\frac{a^3}{\frac{4}{3}a^3} = \frac{3}{4}$ (Ans.)

Question 86-90:

Choose the appropriate word for the blank space to complete the sentence of the following passage:

For the first time, scientists have directly detected gravitational waves, ripples in space-time, in addition to light from the spectacular collision of two neutron stars. This marks the first time that a cosmic event has been viewed in both gravitational waves and light.

The discovery was made using the U.S-based Laser Interferometer Gravitational-Wave Observatory (LIGO); the Europe-based Virgo detector; and some 70 ground and space-based observatories.

Neutron stars are the smallest, densest stars known to exist and are formed when massive stars explode in supernovas. As these neutron stars spiraled together, they emitted gravitational waves that for about 100 seconds; when they collided; a...... light in the form of gamma rays was emitted and seen on Earth about two seconds after the gravitational waves. In the days and weeks following the smashup, other forms of light or electromagnetic radiation including X-ray, ultraviolet, optical, infrared, and radio waves were detected.

The observations have given astronomers a (n)......... opportunity to probe a collision of two neutron stars. For example, observations made by the U.S. Gemini Observatory, the European Very Large Telescope, and the Hubble Space Telescope....... signatures of recently synthesized material, including gold and platinum, solving a decades-long mystery of where about half of all elements heavier then iron are produced.

The LIGO-Virgo results are published today in the journal Physical Review Letters; additional papers from the LIGO and Virgo............ and the astronomical community have been either submitted or accepted for publication in various journals.
